

Just the facts... San Marino is the Best!!!

Most fountains look beautiful when new, but how will they look and perform after a year of rentals? Or after 20 years of rentals? San Marino's goal is for you to be able to generate 100 times your investment over the life of our fountain. That's, on average, a \$50,000 return* on a \$500 investment.

So good, San Marino is the only fountain to ever carry the UL Safety Seal of approval.

San Marino:
Stainless steel drip chains held in place with one mounting ring. No chance of losing one chain.

Others:
Individual chains with hole plugged up by retainer. This causes very little fluid to run down the chains and one chain can be lost easily.

San Marino:
Large finger nut easily mounts and seals nozzle tray.

Others:
No nut at all. This causes fluid to leak from the nozzle tray onto the light bulbs. This causes the bulbs to burn out and corrodes the sockets. This can also contaminate the beverage.

San Marino:
Overflow tube is locked in place and can't go out of adjustment. Clear flexible bottom tube can't break or move.

Others:
Hard plastic tube stuck through hole without support. This can fall out or be pushed out of adjustment.

San Marino:
Large 5/8 inch diameter molded nylon supply tube with large mounting brackets and clear flexible supply line. Large threads don't strip or cross thread.

Others:
Small threads that can be easily worn, misaligned, and stripped. These small threads require many turns to tighten.
Flimsy support brackets that cause parts not to line up properly.

EXCLUSIVE to San Marino:
More efficient pump and motor, designed and manufactured by San Marino. Pump flow is matched to nozzles to prevent over pumping beverage. This keeps carbonated beverages from going flat fast. Easy twist on-off pump housing for cleaning. No little nuts or screws to mess with. Large inlets to accept and pump pulp. Pump motor is air cooled and mounted in the base, away from the beverage.

Others:
Large pumps designed for fish ponds that over pump the beverage and won't allow the fluid level to fall below half before they start sucking air.
Pumps that use a lot of little screws and nuts that make them difficult to clean.
Pump motors mounted in the beverage or exposed to the beverage for cooling. This not only warms the beverage, but the natural acids in the beverage causes this cast aluminum to corrode.
Pump motors running in an oil bath. The only thing keeping this TOXIC oil away from the beverage in a rubber seal. This seal can wear out in time and cause toxic oil to contaminate the beverage. This can result in a serious problem.

San Marino:
One piece tulip with large coupler as standard equipment. Pulp screen under tulip so you can pump the pulpiest beverage. Easy to remove and clean.

Others:
Optional at extra cost. Fastened with small, chrome plated, brass nuts that fade and strip in time. These can be easy to lose and hard to assemble.

San Marino:
Large molded nylon couplers with large threads for easy alignment and no cross threading. No flow adjuster needed.

Others:
Small/fine threads that are easy to misalign, strip, and wear out.
Soldered in flow restrictors that plug up with pulp or even fall out.

San Marino:
All trim is fastened with stainless screws. Bowl trim is attached with welded on studs.

Others:
Pop-riveted trim. Very hard to replace.
Glued on trim.

San Marino's is the Original Splashproof Fountain. Design Patented in 1967

San Marino:
Long, fancy bend nozzles, beaded at back to prevent leaks. Patented Splashproof Design. Clean streamline tip.

Others:
Short nozzles fastened with small, chrome plated brass nuts that can be easily turned and loosened. Short nozzles have less room for filling your glass. Look for the Splash.

San Marino:
Two moisture tight light caps and sockets with pole beaded at bowl end.

Others:
Double sided sockets allowing fluid to run into the top side and corrode the inside.
Odd size light bulbs and sockets that are hard to find replacements for.
Wires and sockets exposed to beverage.
Light poles mounted with soldered in pipe fittings.

San Marino:
Bowl trim is attached with studs welded to bowl. No holes through main bowl. Base and column trim attached with stainless screws.

Others:
Holes through main bowl with trim pop-riveted on. Very difficult to replace.
Trim just glued on with silicone.

San Marino:
Bowl and base are welded together with the same kind of welds holding your car together. All stainless steel bowl and base.

Others:
Bowl and base are glued and soldered together.
Chrome plated steel base that can peel and rust.

This makes it easy to see why San Marino is the SMART choice.
